ROCKGLASS

It has come to our attention that some glass companies have implied either directly or indirectly that their unbreakable product is ROCKGLASS!

Customers should be aware and be diligent to identify what ROCKGLASS has in its specifications, composition and usage profiles.

The unbreakable product that can be substituted for ROCKGLASS may not have several of the properties and specifications that ROCKGLASS has. ROCKGLASS has a Hard Coating (HC) on both sides of the sheets and serves the following purposes:

1. Drastically increased the abrasion resistance to the outer surface (stop scratches).
2. The coating has a proven inhibitor to reduce ultraviolet (UV) transmission that can damage assets and reduces the yellowing effect from the damaging UV rays that are at the high energy end of the solar spectrum.
3. Increases the impact resistance to ROCKGLASS which currently shows impact tests at over 200 ft-lbs. using TAS 201 testing procedures.

Further, ROCKGLASS prides itself on having consistent high-quality sheets that undergo vigorous quality control measures.

The ROCKGLASS Team has for many years researched product and application development. We make a very well designed and build non-sacrificial panels to install on your building to protect your existing glass arrays. We have also developed a Hybrid Sealed Unit in which ROCKGLASS is installed on the outer lite of the unit to protect from breakage, intrusions and random vandalism.

WARNING

Please check the specification of the unbreakable product you are being quoted or sold. If it is not ROCKGLASS it could easily scratch, allow UV to damage items and prematurely yellow that hastily ruins the clarity.

If you have a concern about what is being quoted or sold to you, please contact us and we will work to clarify the concern.

The ROCKGLASS Team.
